AMENDMENT TO THE CLAIMS:

The following claim set replaces all prior versions, and listings, of claims in the application:

- 1. (currently amended) Preformed sheet comprising at least two mono-layers, each mono-layer containing unidirectionally oriented fibers having a tensile strength of at least about 1.2 GPa and a tensile modulus of at least 40 GPa, and a binder, with a fibre direction in each mono-layer being rotated with respect to the fibre direction in an adjacent mono-layer, and a non-fibrous separating film on both outer surfaces, wherein the separating film has a porosity of between 40 and 90 %.
- (original) Preformed sheet according to claim 1, wherein the fibres comprise high- performance polyethylene fibres.
- (previously presented) Preformed sheet according to claim 1, wherein the binder consists essentially of a thermoplastic elastomer and has a tensile modulus of less than about 40 MPa.
- (previously presented) Preformed sheet according to claim 1, wherein the separating film is made from ultra-high molar mass polyethylene.
- (previously presented) Preformed sheet according to claim 1, wherein the separating film is a biaxially stretched film.
- (previously presented) Preformed sheet according to claim 1, wherein the separating film has an areal density of between 2 and 4 G/M².
- (previously presented) A preformed sheet according to claim 1, wherein the separating film has a strength factor of at least 150 N/m.

JACOBS et al Serial No. 10/584,754 February 24, 2009

- (previously presented) A preformed sheet according to claim 1, comprising two mono- layers of unidirectionally oriented fibres.
- 9. (currently amended) Assembly of at least two sheets which are not linked to one another, wherein each of the at least two sheets comprises at least two monolayers, each mono-layer containing unidirectionally oriented fibers having a tensile strength of at least about 1.2 GPa and a tensile modulus of at least 40 GPa, and a binder, with a fibre direction in each mono-layer being rotated with respect to the fibre direction in an adjacent mono-layer, and a non-fibrous separating film on both outer surfaces, wherein the separating film has a porosity of between 40 and 90 %
- 10. (currently amended) Flexible ballistic-resistant article comprising at least one assembly comprised of at least two sheets which are not linked to one another, wherein each sheet comprises at least two mono-layers, each mono-layer containing unidirectionally oriented fibers having a tensile strength of at least about 1.2 GPa and a tensile modulus of at least 40 GPa, and a binder, with a fibre direction in each mono-layer being rotated with respect to the fibre direction in an adjacent mono-layer, and a <u>non-fibrous</u> separating film on both outer surfaces, wherein the separating film has a porosity of between 40 and 90 %.
- 11. (currently amended) Flexible ballistic-resistant article comprising an assembly, which contains a plurality of sheets containing at least two mono-layers, each mono-layer consisting essentially of unidirectionally oriented high-performance polyethylene fibres having a tensile strength of at least 1.2 GPa, with the fibre direction in each mono-layer being rotated with respect to the fibre direction in an adjacent mono-layer, and two non-fibrous polyethylene separating films having a porosity of between 40 and 90 % on both outer surfaces, the assembly having an areal density of at least 1.5 kg/m² and a specific energy absorption of at least
